

Many organizations have Backup and Recovery processes in place but have not kept up with the enhancements in services and cloud backup options.

Intelligent Data Protection is a comprehensive approach to data protection and copy data management that focuses on how an organization protects and uses its data (now and in the future). Is your organization prepared? What is your backup policy? What are your retention policies? Have you tested a recovery? Is your backup data immutable? Have you considered cloud backup options?

Allow us to do a high-level review of your Backup and Recovery environment, and compare it to best practices and patch levels. We'll follow up with a scheduled session to review our findings and provide recommendations.
